

What's Your Style?

Learning Styles with the Brain in Mind

By John Joseph

SITE-LICENSED with FULL NETWORK CAPABILITIES.

At last! A fully interactive, computer based instrument for introducing Learning Styles to your class.

Numerous research studies and long term observations of how people approach new learning tasks have confirmed that some learning styles are more suited than others to particular methods of instruction and assessment; particular occupations, and particular relationships with other people. Mismatches between students' learning styles and their teachers' instructional methods can prove to be a major contributing cause of learning difficulties or underachievement in classrooms.

This brilliant CD-Rom and accompanying teachers' manual characterises individuals in light of the latest findings into how the brain learns. Using video clips and interactive technologies, it examines the ways the brain processes information, and explains how to construct learning episodes that utilise the styles of every student in your class. At the core of this tool is an extensive computer-based questionnaire for students and teachers. The result is a plot of the user's profile, which can be saved, exported and evaluated with a number of outcomes in mind.

This is a fully featured application with many new additions for both students and teachers. New features include the capacity for students to interactively learn about the relationships between learning profiles and career paths and to compare their own profiles to possible future careers. They can also build a profile of their friends, classmates and family. Students can undertake an activity that allows them to interactively select and prioritise their favourite teaching strategies and they can construct a personal learning framework designed to utilise their specific talents and interests. This is an engaging, interactive and highly educative tool.

Enjoy bringing the world of Learning Styles to every student in your class
